

Week 12 – Capstone Progress Documentation

Project ID: PW26_MG_02

Overview

During Week 12, the capstone project progressed significantly through design consolidation, system structuring, and presentation refinement, with continuous guidance shaping every stage of development. The transformation of the conceptual framework into a clearly structured architecture was carried out through regular and engaging discussions, where each interaction contributed to improving clarity, coherence, and alignment with real-world financial systems. The refinement of the PPT, including abstract, methodology, architecture, and design components, was a highly collaborative process, where every iteration felt constructive and encouraging. The guidance provided not only strengthened the technical aspects but also made the entire process enjoyable and motivating, creating a positive learning environment where ideas could be explored openly and confidently.

Progress Update

A key milestone during this week was the shortlisting of the project for the JPMorgan Technology Innovation Forum 2026, where it was presented before the JPMorgan panel. This achievement reflects the strength of the project's conceptual clarity, structured design, and effective articulation, all of which were developed through continuous and supportive guidance. The preparation for this presentation involved multiple iterations, where each refinement in explanation, flow, and structure was shaped through collaborative discussions, making the process both insightful and rewarding.

The system design was further strengthened by formalizing a modular, polyglot architecture and a well-defined methodology integrating monitoring, explainability, decision-making, and execution layers. Each component was refined through interactive discussions, ensuring that the system remained logically consistent, practically feasible, and easy to understand. The architecture was structured into clear layers, with guidance ensuring clarity in responsibilities and smooth system flow. Detailed design artifacts such as class diagrams, use case diagrams, ER diagrams, and report layouts were developed through continuous feedback, where each iteration improved both clarity and confidence.

Technology and tool exploration were also guided to ensure alignment with the system's modular design, making the development process structured and efficient. Throughout this phase, the collaboration remained positive and engaging, where every discussion contributed to better understanding and stronger outcomes. The experience of working together in this manner made the entire process not only productive but also genuinely enjoyable.

Upcoming Work

Upcoming work will focus on transitioning from structured design to deeper implementation, including integration of system modules, development of data pipelines, and enhancement of explainability mechanisms. Continued guidance will ensure alignment between design and implementation, maintaining clarity and consistency. The same collaborative and supportive approach will continue to play a key role in ensuring steady progress and a smooth transition toward a fully functional and scalable system.
